Model: AE-ENTLH-MAX-1Y

Manufacturer: OPENGEAR

EAN:

Product Code: 1065898

R1,915,478

A clear view across your
Network Resilience Platform

Lighthouse software provides access to your network devices via connected console servers at each location. As an API-driven platform with an HTML5 interface, it provides secure access to remote networks regardless of how they are connected or how a user interacts with the system.

When deployed across a distributed enterprise of data centers and edge locations, Lighthouse is the control center of a comprehensive Network Resilience Platform, independent of the production network.

Lighthouse is available in Enterprise and Automation Edition.

Lighthouse Enterprise Automation edition includes all the features of the Enterprise edition. Additionally enhanced with Smart Management Fabric, it is designed to help network professionals, system administrators, and IT support teams. This edition aims to save time and effort by providing dynamic routing-based access to IP endpoints.

Navigate Your Network

Get unparalleled visibility of distributed networks through a single pane of control. Designed with security, scalability and automation in mind.

Lighthouse Enterprise: Automation Edition

This advanced offering provides users with additional functionality needed for automation and operation. The expanded automation edition contains all the features of Lighthouse Enterprise – it also includes Automation Gateway and Secure Provisioning for every node.

Lighthouse Enterprise: Automation Edition

All the features of Lighthouse Enterprise, now with Opengear’s new Smart Management Fabric (SMF) to enable a unified management framework.

With the latest updates to Lighthouse and Opengear’s newest appliance software, Opengear now offers customers a dynamic routing-based IP-access solution integrated with our Network Resilience Platform.

SMF extends the value and functionality of our Smart Out of Band solution by enabling a unified management framework.

Scalability: SMF uses industry standards and dynamic IP-routing protocols for scalable machine-to-machine and user-to-machine connectivity in an out-of-band network and more.
